The Global Findex Database 2017 Dec 30 2022 In 2011 the World Bank—with funding from the Bill and Melinda Gates Foundation—launched the Global Findex database, the world's most comprehensive data set on how adults save, borrow, make payments, and manage risk. Drawing on survey data collected in collaboration with Gallup, Inc., the Global Findex database covers more than 140 economies around the world. The initial survey round was followed by a second one in 2014 and by a third in 2017. Compiled using nationally representative surveys of more than 150,000 adults age 15 and above in over 140 economies, The Global Findex Database 2017: Measuring Financial Inclusion and the Fintech Revolution includes updated indicators on access to and use of formal and informal financial services. It has additional data on the use of financial technology (or fintech), including the use of mobile phones and the Internet to conduct financial transactions. The data reveal opportunities to expand access to financial services among people who do not have an account—the unbanked—as well as to promote greater use of digital financial services among those who do have an account. The Global Findex database has become a mainstay of global efforts to promote financial inclusion. In addition to being widely cited by scholars and development practitioners, Global Findex

data are used to track progress toward the World Bank goal of Universal Financial Access by 2020 and the United Nations Sustainable Development Goals. The database, the full text of the report, and the underlying country-level data for all figures—along with the questionnaire, the survey methodology, and other relevant materials—are available at www.worldbank.org/globalindex.

Personal Current Account Banking Services in Northern Ireland Market Investigation Sep 15 2021
The Commission's report examines the market for personal current account (PCA) banking services in Northern

Ireland, following on from a supercomplaint made by Which? and by General Consumer Council for Northern Ireland under the Enterprise Act 2002. This provisional report finds that banks have unduly complex charging structures and practices which are not sufficiently explained, and customers generally do not actively search for alternative PCAs or switch provider. It concludes that, despite significant changes in recent years, without effective remedial action the market as a whole will remain uncompetitive.

Capital Mobility, Exchange Rate Regimes and Currency Crises Dec 06 2020 This book examines the determinants of real exchange rates (RERs), with an emphasis on the roles of a pegged exchange rate regime and capital account opening in driving the persistent real exchange rates appreciation in the lead-up to the 1997 currency crisis, through an in-depth case study of Thailand. The book aims to inform the debate, rekindled by the recent currency crises in emerging market economies, on exchange rate policy choice and the timing and sequencing of capital account opening.

Investigating the Determinants of Current Account Balances Sep 22 2019 Current account conveys the information regarding the actions and expectations of all market participants in open economy. This book applies the approach of Generalized Method of Moments to investigate the determinants of current account balances. The objectives of this research are to investigate the determinants of current account dynamics and to compare the determinants of current account between two groups of countries, i.e. countries with current account surpluses and countries with current account deficits. Research sample consists of ten countries has been used. These countries are Australia, Cyprus, Italy, Portugal, United States,

Germany, Japan, Singapore, Norway and Switzerland. The result of the study indicates that terms of trade and trade openness are statistically significant in influencing current account surpluses. Besides, the world oil price and reserve accumulation give mixed impacts to the current account deficits. Meanwhile, nominal effective exchange rate, interest rate and CPI are less statistically significant in influencing current account deficits. Productivity has the positive impact to the current account surplus. There are some determinants that have i

G7 Current Account Imbalances Jul 25 2022 The current account deficit of the United States is more than six percent of its gross domestic product—an all-time high. And the rest of the world, including other G7 countries such as Japan and Germany, must collectively run current account surpluses to finance this deficit. How long can such unevenness between imports and exports be sustained, and what form might their eventual reconciliation take? Putting forth scenarios ranging from a gradual correction to a crash landing for the dollar, G7 Current Account Imbalances brings together economists from around the globe to consider the origins, status, and future of those disparities. An

esteemed group of collaborators here examines the role of the bursting of the dot-com bubble, the history of previous episodes of current account adjustments, and the possibility of the Euro surpassing the dollar as the leading international reserve currency. Though there are areas of broad agreement—that the imbalances will ultimately decline and that currency revaluations will be part of the solution—many areas of contention remain regarding both the dangers of imbalances and the possible forms of adjustment. This volume will be of tremendous value to economists, politicians, and business leaders alike as they look to the future of the G7 economies.

***Who Needs to Open the Capital Account* May 23 2022**
Most countries emerged from the Second World War with capital accounts that were closed to the rest of the world. Since then, a process of capital account opening has occurred, with the result that all developed and many emerging-market countries now have capital accounts that are both de facto and de jure open, while many developing countries also have de facto openness. This study examines this in part by considering some of the first lessons from the current global financial crisis. This crisis may change the terms of the debate on capital account liberalization in a deeper and more lasting way than any of the crises of the past two decades because it may mark a reversal in the secular trend of financial liberalization at the core of the international financial system. The current crisis also raises new questions about the appropriate policy responses to boom-bust dynamics in domestic credit and in international credit flows. Intellectual consistency is needed between the domestic and

international dimensions of financial regulation and the policies aimed at dealing with boom-bust dynamics in domestic and international credit.

Pension Reform, Private Saving, and the Current Account in a Small Open Economy Aug 26 2022 The macroeconomic implications of a pension reform that substitutes a high-return fully-funded system for a low-return pay-as-you-go system are discussed in an overlapping generations, neoclassical growth model. With forward-looking individuals, a debt-financed reform worsens the current account, while a tax-financed reform leaves the current account unchanged. With myopic individuals, a debt-financed reform leaves the current account unchanged, while a tax-financed reform improves the current account. Hence, tax-financing, which is equivalent to pre-funding, should be the preferred reform strategy in a small open economy with a weak current account position.

Macroeconomic Uncertainty, Precautionary Savings and the Current Account Mar 29 2020 The relationship between current account developments and changes in the macroeconomic environment remains a key issue in open economy macroeconomics. This paper extends the standard intertemporal optimizing model of the current account to incorporate the effects of macroeconomic uncertainty on private savings behavior. It is shown that the greater the uncertainty in national cash flow, defined as output less investment less government expenditure, the greater is the precautionary demand for savings and, other things equal, the larger is the current account surplus. Empirical support for the model is found using quarterly data from four large industrial countries.
